

Hospital Management System

Ravi Teja Bonam - 11492029

CSCE 5350 Section 004 - Fundamentals of Database Systems (Fall 2021 1)

Title: Hospital Management System

Description: This project aims to provide a database system for hospital administration that includes online appointments, room allocation for appointments, patient discharge and insurance management, and medication of patients. Admin, doctor and patients are the three candidates able to access this project. Each candidate has a distinct level of system usefulness. For example, an administrator can add doctors and patients, schedule appointments, and assign rooms with all of the required information. The doctor can verify their appointments so that they can be treated, discharged, and given medicine. Patients can also request an appointment by logging into the system for their health concerns, which can be approved or denied by admin.
